#### REMARKS

The application has been amended as needed so as to place it in condition for allowance at the time of the next Official Action.

The Official Action had objected to the drawings as they allegedly failed to show every feature of the invention specified in the claims. Specifically, the Official Action indicated that "a compression force to the entire U shaped piece in order to round the section until the required roundness is obtained" must be shown or the feature canceled from the claims. No new matter should be entered.

Reconsideration of the objection to the drawings is respectfully requested for the following reasons.

As was indicated to the Examiner in a telephone conversation, all the claims are directed to a bending method for producing a coil having return sections bent at 180°. Section 601.01(f) of the Manual of Patent Examining Procedure (MPEP) states that it has been USPTO practice to treat an application that contains at least one process or method claim as an application for which a drawing is not necessary for an understanding of the invention. In addition, the specification explains in greater detail on page 6, lines 20-23 that this method step of applying a compression force to the entire U shaped piece in order to round the sections until the required roundness is obtained, is carried out with a press including a

mold having the shape of the U shaped piece with the required roundness. Finally, since none of the claims are drawn to an apparatus, it is believed that no additional drawings are required.

Claims 4 and 12 were rejected under 35 USC §112, second paragraph, for indefiniteness. The Official Action states that the claims are incomplete as they omit essential elements, such omissions amounting to a gap between the elements. The omitted elements are "schedule 40 to XXS". In addition, the expression "the process" in claim 11, and the expression "the return sections" in claim 12 lack sufficient antecedent basis.

Reconsideration of the above rejection is respectfully requested for the following reasons.

There is submitted herewith in the Appendix to this amendment several printouts from the Internet, which explain the schedule designation used by the industry to describe the wall cross-sectional dimension of most pipes. As can be readily appreciated from these printouts, a schedule XXS refers to a double extra strong wall. These schedule designations are well known by a person having ordinary skill in the art, as is evidenced by the accompanying printouts. Accordingly, the claims are complete within the meaning of 35 USC §112, second paragraph. With respect to the lack of antecedent basis for the expression "the process" in claim 11, and "the return sections" in claim 12,

Docket No. 9016-1002 Appln. No. 10/769,904

it will be seen that these claims have been amended so as to eliminate the perceived lack of antecedent basis.

In view of the present amendment and the foregoing remarks, therefore, it is believed that this application has been placed in condition for allowance. Reconsideration and allowance on the basis of claims 1-12 are accordingly earnestly solicited.

In the event that there are any questions relating to this amendment or to the application in general, it would be appreciated if the Examiner would telephone the undersigned attorney concerning such questions so that the prosecution of this application may be expedited.

The Commissioner is hereby authorized in concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 25-0120 for any additional fees required under 37 C.F.R. § 1.16 or under 37 C.F.R. § 1.17.

Respectfully submitted,

YOUNG & THOMPSON

#### APPENDIX:

The Appendix contains the following items:

- three printouts from the Internet, which explain the schedule designation, entitled "Hose, Pipe, and Tube Fittings", "Howell Pipe & Supply - Leader of the Pack in Customer Service", and "Carbon Steel, Pipes & Tubes, Carbon Steel Pipe, Low Temperature Carbon Steel, Buttweld Fitting, F..."

## **Table 4 - WALL THICKNESS DESIGNATIONS**

#### FOR USE WITH MRC CWFG

Schedule designation is used by industry to describe the wall cross-sectional dimension of most pipe.

Thickness class denotes wall thickness of cast iron pipe. Standard or Extra Strong are terms used to denote wall thickness of Copper or Copper Alloy (including Brass or Bronze) Pipe. Class denotes wall thickness of lead and lead alloy pipe. Weight is used to denote wall thickness of case soil pipe. See Appendix C, Tables 1 through 8, for appropriate wall thickness designations.

SCHEDULE DESIGNATION for Pipe, Steel; Pipe, Corrosion Resisting Steel; Pipe Aluminum and Aluminum Alloy; Pipe, Nickel and Nickel Alloy; Pipe, Wrought Iron; and Pipe, Cast Iron, Threaded.

## **General Information**

# Dimensions (steel and wrought iron pipe)

In sizes from 1/8-inch thru 12-inch, pipe is known by its nominal inside diameter, which differs somewhat from the actual inside diameter. Early pipe manufacturers made the walls in the smaller sizes much too thick, and in correcting this error in design they took the excess from the inside to avoid changing the sizes of the companion fittings. To distinguish pipe sizes from actual measured diameters the terms iron pipe size (IPS) or nominal pipe size (NPS) are usually used. For sizes larger than 12-inch, pipe is known by its actual outside diameter. In all pipe sizes the outside diameter (OD) remains relatively constant; variations in wall thickness affect only the inside diameter (I.D.).

To distinguish different weights of pipe, three long standing traditional designations are used: standard wall (Std., extra strong wall (XS) and double extra strong wall (XXS). These last two designations are sometines referred to as extra heavy wall (XH) and double extra heavy wall (XXH), respectively.

For the purpose of standardizing pipe dimensions, the American Standards Association (ASA), sponsored by the American Society for Testing Materials (ASTM) and the American Society of Mechanical Engineers (ASME), published ASA. B36.10. To broaden the range of wall thicknesses, schedule numbers from schedule 10 (S.10) thru schedule 160 (S.160) were adopted for steel pipe. These schedule numbers indicate approximate values for 1000 times the pressure-stress ratios. Later, stainless steel schedule numbers from schedule 5S through schedule 80S were published in ASA B36.19 for sizes thru 12-inch. The addition of the letter S after the schedule number identifies it as pertaining to stainless steel.

Certain relationships exist among the traditional designations of Std, XS, XXS, the ASA schedule numbers and the actual wall thicknesses. Std and S.40 are the same in sizes thru 10-inch; in sizes above 10-inch, Std has a wall of 3/8-inch. XS and S.80 are the same in sizes thru 8-inch; in sizes 10-inch and above, XS has a wall of 1/2-inch. XXS has no corresponding schedule number, but in sizes thru 6-inch, XXS has a wall twice as thick as XS. Stainless steel schedules 40S and 80S are identical with carbon steel designations Std and XS, respectively, thru 12-inch.

Weighs for carbon steel pipe are based on a density of 0.2833 pounds per cubic inch; for wrought iron pipe the density is 0.2777 pounds per cubic inch. Since wrought iron pipe is made to steel outside diameters and steel weights per foot, the wall thicknesses of wrought iron pipe are necessarily slightly greater than steel pipe to compensate for this difference in densities. Wrought iron pipe is referred to as Std, XS, and XXS and not by schedule numbers.

Unless otherwise designated, references to pipe wall and thickness always mean the nominal, or average, wall thickness. Most ASTM tolerances on regular pipe products specify that the wall thickness of pipe at any point is to be no more that 12-1/2% under the nominal wall thickness specified. This means that a minimum wall of 0.875 times the niminal wall could apply for regular mill rolled pipe.

Unless ordered to cut lengths, at a higher price, pipe is supplied in random lengths (RL). This is due to the method on manufacture where damaged ends of each length are cut away during the finishing operations. For Std pipe a single random length usually falls in the range of 16 to 22 feet.

Threaded and coupled (T&C) pipe has threads that taper 3.4-inch per foot on the diameter for all sizes. Threads conform with the ASA B1.20.1. End to end measurements of T&C pipe include the attached coupling.

Return to Top

# Steel Pipe

#### Standard Wall

*Unless otherwise specified:* standard wall steel is furnished black; with threads and couplings; in random lengths; butt-weld in sizes 3-inch and smaller.

Random Lengths are considered to be 16 to 22 feet. We reserve the privilge, however, of supplying not more than 5% of the total number of lengths as "joiners" (two pieces coupled together) and, when ordered with plain ends, of supplying not over 5% of the total order in lengths 12 to 16 feet.

Cut Lengths carry an extra charge over random lengths.

Ends are available in plain (square cut) in all sizes and beveled in sizes 1-1/4 inch and larger.

Threads have a taper for all sizes of 3/4-inch per foot measured on the diameter.

Weights and dimensions are nominal. Permissable variation in weight is approximately 5% above and 5% below those shown. Weight per foot of pipe with threads and couplings is based on a length of 20 feet including coupling. Minimum wall thickness at any point shall not be more that 12.5% under nominal wall.

# **Extra Strong Wall**

Unless otherwise specified: extra strong wall steel pipe is furnished black; with plain ends; in random lengths; butt-weld in sized 3-inch and smaller.

Please see above Standard Wall specifications for lengths, ends, and weight notes.

#### **Double Extra Strong Wall**

Unless otherwise specified: double extra strong wall steel pipe is furnished black; with plain ends; in random lengths.

Random Lengths are considered to be 12 to 22 feet. We reserve the privilge, however, of supplying not over 5% of the total order in lengths 6 to 12 feet.

Ends furnished with threads and couplings at an extra charge over plain ends.
